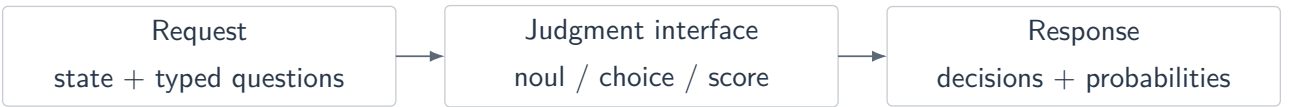
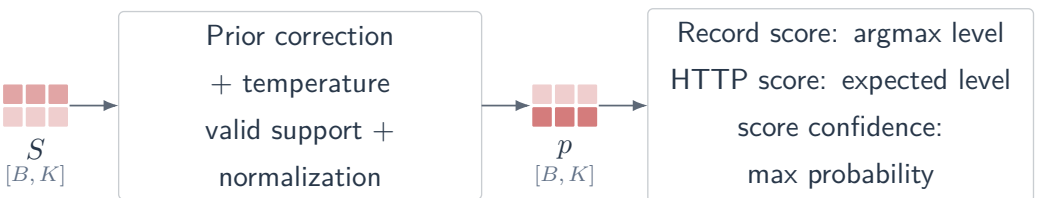
$$\text{state} + \{\text{typed questions}\} \longrightarrow \{\text{decisions}, \text{probabilities}\}$$

System One public interface: an observable request–response contract



MetisCraft realization: explicit scores and task-aware probability transforms



Axes B counts atomic questions, not requests. K is padded candidate capacity; noul has a single positive logit. $p : [B, K]$ is an internal unifying view, not a claim about private System One tensors.

Meaning Public outputs specify behavior, not proprietary architecture. MetisCraft implements four Record types, including multi_label; its current HTTP protocol exposes three types. A probability is confidence assigned by the model, not a correctness guarantee.

Cell counts illustrate axes, not model sizes; tint identifies roles, not numeric values.
